Date	03 October 2026
Team ID	**SWTID-2026-7735**
Project Name	**Auto Ticket Classification using Flow Designer**
Maximum Marks	4 Marks

Ideation Phase

Empathize & Discover

Empathy Map Canvas:

An empathy map captures knowledge about a user's behaviours and attitudes to design user-centered solutions.

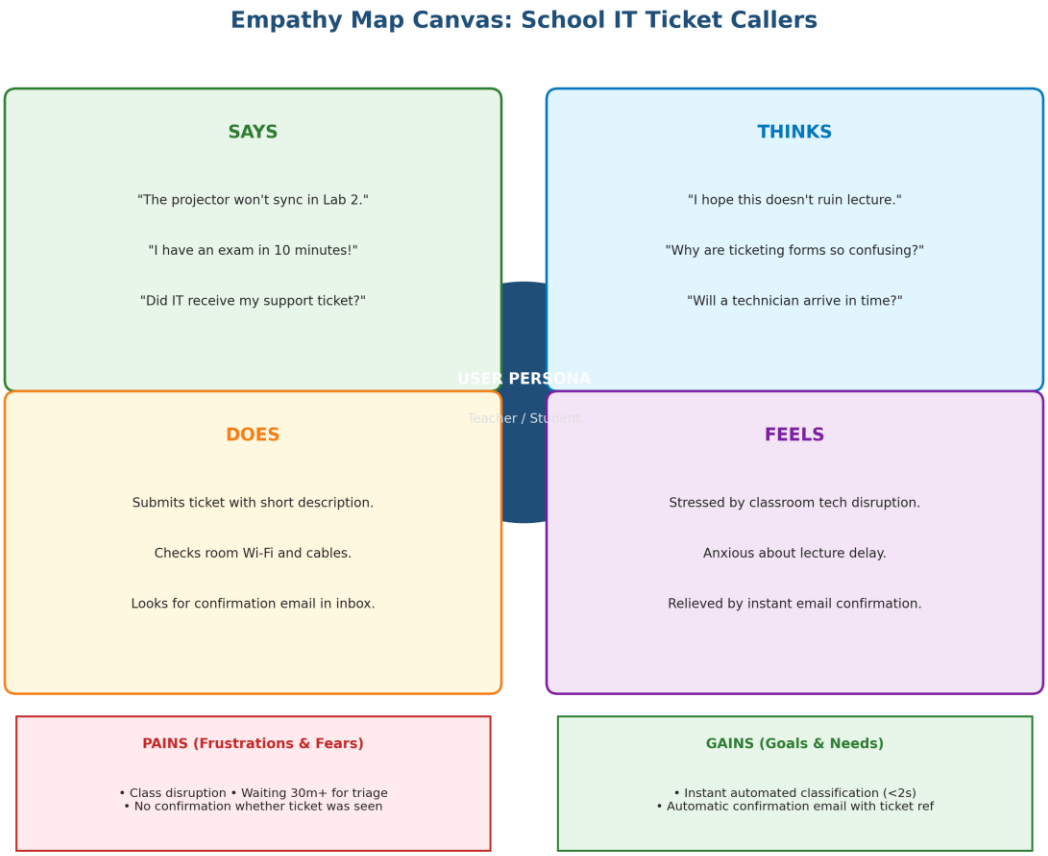

Figure 1.4: Empathy Map Canvas for School Callers and IT Resolvers

User Persona 1: School Teacher / Student (The Caller)

Canvas Dimension	Observations & Insights

1. Who are we empathizing with?	Teachers, academic faculty, and students who depend on classroom IT equipment (Wi-Fi, projectors, PCs).
2. What do they need to do?	Log issues in under 30 seconds with simple phrases like 'Wi-Fi down in Lab 2' and receive instant confirmation.
3. What do they SEE?	A blank projector screen during a lecture, 'No Internet' error on student laptops, intimidating IT drop-downs.
4. What do they SAY & DO?	They say: 'I just need someone to fix the projector right now!'. They submit tickets and wonder if anyone received it.
5. What do they HEAR?	Colleagues complaining: 'IT tickets take forever to get acknowledged', 'You have to call them directly'.
6. Pains & Gains (THINK & FEEL)	PAINS: Fear of class disruption, tedious forms. GAINS: Immediate confirmation email, automated categorization, rapid technician dispatch.

User Persona 2: IT Helpdesk Support Staff (The Resolver)

Canvas Dimension	Observations & Insights
1. Who are we empathizing with?	Junior IT helpdesk technicians handling daily campus hardware, network, and account maintenance.
2. What do they need to do?	Focus their time and skills on physical equipment repair, access restorations, and system troubleshooting.
3. What do they SEE?	A cluttered general inbox filled with unclassified incident records waiting for manual sorting.
4. What do they SAY & DO?	They say: 'I spent half my morning just reading tickets and clicking Network or Hardware'.
5. What do they HEAR?	Escalations regarding delayed ticket response times and inconsistent categorization reports.
6. Pains & Gains (THINK & FEEL)	PAINS: Repetitive administrative triage, human categorization error. GAINS: Zero manual triage, instant structured routing, accurate reporting.
